

Yjing

English instruction manual.

Before installing Yjing :

Make sure that you have :

- An apache server
- A PHP server, with PHP version > 5
- libxml2 installed on your PHP server
- A recent browser (not that Internet Explorer crap, but anyway, who use it today ?)
- Some skills in PHP (It's our first release, and some bugs may be here) for debugging
- Some skills in HTML, we haven't made yet a WYSIWYG editor

Yjing doesn't use MySQL or any database, it just uses a XML file to save the modifications. You'll maybe need to «chmod» it (change the permissions), so that the server can edit it.

Downloading Yjing

To download Yjing, go to <https://github.com/tibounise/Yjing>. Then click on the button to download a zip of Yjing. You can also clone our Github using Git, if you want to participate on the project !

Installing Yjing

You've now downloaded Yjing. You'll need to unzip the file that you've downloaded if you used the «zip» button. Drag the files and folders where you want to install Yjing. To be sure that your installation will be correct, just chmod the «data.xml» and the «params.php» files (chmod them to 777).

You've copied Yjing on your server. Now go with your web browser to the place where Yjing is stored. Yjing will redirect you to this page :

Yjing - Installation

Step 1

Step 2

Step 3

Step 4

It's setup time !

Thank's for downloading Yjing ! We're proud that you've installed our software.

During this installation, you'll be guided by our wizard. It will give you the instructions to help you to install Yjing.

Click "Step 2" to continue ...

Yjing is under GNU GPL v3 licence. The Twitter Bootstrap is under Apache Licence v2.0

Click on the step 2 button (on the black bar in the top) and you should see this :

Yjing - Installation

Step 1

Step 2

Step 3

Step 4

Give us a login !

When you will want to create articles or pages, you'll need to log on the back-office. But to protect the back-office, you'll need to set a login.

Username :

Only alphanumeric characters.

Password :

Only alphanumeric characters too.

Yjing is under GNU GPL v3 licence. The Twitter Bootstrap is under Apache Licence v2.0

Fill the two fields, with a username and password (choose the strongest one that you can remember). Click on continue and you'll be asked for a name for your website :

Yjing - Installation

Step 1

Step 2

Step 3

Step 4

Let's customize your site !

We want Yjing to be your website. So it needs to fit you !

Title of the website :

Only alphanumeric characters.

Yjing is under GNU GPL v3 licence. The Twitter Bootstrap is under Apache Licence v2.0

This will be the name of your website, that will appear in the top of your site. You'll be able to change it later, in the administration panel. Click on «Continue» and you'll have this message :

Your website is ready to be used !

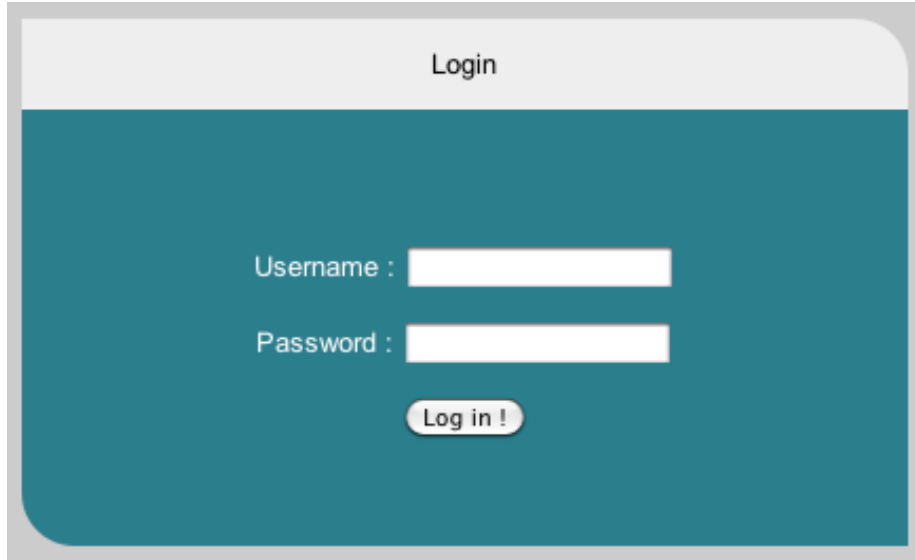

Yeah, that was fast and easy ...

[Go to your website !](#)[Go to the administration panel !](#)

And yes, your site is installed ! Click on «Go to your website !» to see it !

The administration panel

You've just setup your website. That's nice, but you want to publish articles and pages ? Go to «/admin». You'll see this :

A login form titled "Login" with a teal background. It contains two input fields: "Username :" and "Password :". Below the password field is a "Log in !" button.

Enter your username and your password (that you've typed when you were installing Yjing) to log in. You'll now see the home page of the administration panel :

Welcome to Yjing

Your administration panel is ready.

You need some help ?

You can read the manual [here](#). There's also my Twitter account : [@tibounise](#).

You can log out by click the «Log out» button in the top right corner :

Log out

Notes on creating articles

We're not going to cover how to create articles (I think you're enough intelligent to know how to do it) but theres a few rules :

- Use standart HTML tags like `<p>` `` `<audio>` `<video>`
- For medias, use for url media/****name of your file****
- ***Don't put <html> <head> <body> tags ! They're already in the template !***

Managing medias

To make easier the redaction of articles, we've made a media manager. You can access it by the sidebar. Click on «Add a new media» and follow the steps to upload your files.

To remove any media, go to «Manage medias», and click on the «X» in front of the name of the file that you want to delete. You'll see a confirmation message to prevent deleting files by error.

Site configuration

The configuration panel allows you to change the theme of your site, the message for a 404, the message for a 403 (not implemented), the number of trials before disallowing to log in, the content of your sidebar (the bar in the top your site) and the name of your site.

The configuration panel look like this :

Edit config

Name of the site :	<input type="text" value="Yjing test website"/>
Content of the sidebar :	<div><div>Your first article !</div><div></div></div>
Error 404 message :	<div><div><h1>Oh oh !</h1>
<p>We havn't found the file that you were looking for.</p></div><div></div></div>
Error 403 message :	<div><div><h1>Oh oh !</h1>
<p>You may not stay here. Private access, and stuff like that ...</p></div><div></div></div>
Theme options :	<div>twitter_bootstrap</div>
Numbers of login tentatives :	<div>5</div>

Save changes

Creating your own theme

You may want to get a site more close to your minds. We've made the way of making themes the simplest as we could do it !

Begin by creating a folder with the name of your theme in */themes*.

Now create a theme.php file that may look like this :

```
<?php

function showArticle($site_title,$navigation_bar_content,$article_title,$article_pubdate,$article_author,
$article_content) {
    // Your code to show an article using the theme
}

function showPage($site_title,$navigation_bar_content,$page_content) {
    // Your code to show a page using the theme
}

?>
```

You can add your own ressources in your theme's folder. Take a look at the `twitter_bootstrap` folder if you don't know how to make a theme for Yjing.
